ZERONINE THERMAL TRANSFER RIBBONS

NEXGEN RIBBONS

Chemical resistance
Abrasion resistance
UV resistance
Better transfer at higher print speeds
Improved resolution
Compatible with more materials than ever before
Process prints closely match OEM process prints

LEGACY RIBBONS

Legacy ribbons are the original formulation brought to you since 1998. Legacy process colors are known for their vibrancy. The Zeronine legacy line includes Mirrors, Metallics, ShadowCasts, and Hologram ribbons. Legacy process color foils are known to be more vibrant and eye catching than any alternative. Using Legacy ribbons will save you at least 40% over the OEM.

ZeroNine

SPECIALTY RIBBONS

SHADOWCAST is a printable transparent black that is excellent at producing shadows. It helps give your graphics dimension. A single "hit" of ShadowCast gives the illusion of many colors, shades, and shapes. ShadowCast leaves no dot pattern either! ShadowCast is nearly a 10% black tint and when printed on top of colors it gives a shadow effect. It is over-printable also, so a double hit of ShadowCast in certain places of the job will give even more dimension because it would add up to a 20% tint, and third hit is a 30% tint. Using ShadowCast allows artists to make 3D depth and shadows in all of their graphics.

TINTING WHITE is a NexGen transparent white special purpose ribbon used to lighten up colors. It was designed to be overprinted on top of all of our colors to show high spots, bevels, and highlights. Printing Tinting White onto colored substrates can make color glows and other effects. You can use multiple "hits" of Tinting White for more pronounced effects. Tinting White simply doubles the amount of colors that are available in your palette by using it in conjunction with another ZeroNine vibrant color. Tinting White also has NexGen chemistry in it, causing it to resist damage from UV, chemicals, and abrasion.

HOLOGRAM RIBBONS print the holographic pattern where you want it. It is unique because the alternative way to have a hologram pattern in your design is to purchase hologram vinyl and print the ribbon on top. Using hologram vinyl isn't always good because some colors are more transparent than others which may leave an undesired effect depending on the circumstances. Using a hologram ribbon instead of vinyl is also cheaper because you can use less, and the overall cost is more affordable. Hologram ribbons are available in a Polka Dot pattern and Digital pattern. These colors are available in 25 yard rolls.

RUBY POSITIVE is a unique color designed specifically to print on polyester. It is a useful ribbon for screen printers so they can design and burn screens digitally.

MIRROR COLORS have a lasting effect on everybody who looks at them. The mirror ribbon can reflect light just as easily as you would expect. Zeronine mirror ribbons are available in Gold and Silver. These colors are available in 50 and 25 yard rolls.

FROGSKIN is the market's foil of choice for protecting their graphics. The ribbon prolongs life of any graphic because it is a chemical, UV, and abrasion resistor. Anytime a graphic is going outside, we recommend putting FrogSkin on it to help it last longer than ever predicted. FrogSkin has three key ingredients. First, an ultraviolet filtering additive increases the durability of colors and materials by blocking the damaging effects of sunlight. Second, a chemical resistance additive defends against fuels, alcohol, oils, and cleaners. Third, an abrasion guard shields against sand, dirt, and car wash brushes. FrogSkin is also useful when printing on difficult clear substrates. All of the Zeronine colors are designed to print on top of FrogSkin.

FINISH COAT SEMI GLOSS RIBBON is designed to give your designs a professional edge over your competition. The foil is a clear overprintable foil with a glossy finish result. Once your customers get a taste of a graphic coated with Finish Coat Semi Gloss, they will never leave you!

SUPER OPAQUE BLACK is a deep black foil specially made for printing on static cling vinyl. It has been proven on a densitometer that our Super Opaque Black can withstand more light than any alternative black ribbon. When printing on clear vinyls, you don't need any white primer to back this foil!

CONDUCTIVE RIBBON is a highly conductive thermal transfer ribbon designed for the printed electronics industry and our Digital™ vinyl. Conductive Ribbon makes prototyping and doing one-off designs possible because they are digitally printed as opposed to screen-printing. When you use this foil, you can then make a flexible circuit that can be rolled up. This functional ribbon is the important component in lighting a sign using Zeronine Digital™ Electroluminescent Material. Wherever you print the ribbon on the Digital vinyl, the vinyl illuminates on the reverse side.

ZeroNine

ZERONINE FX RIBBONS

ZeroNine offers thermal transfer ribbons specifically for use on the Gerber EDGE® FX printer. ZeroNine's FX refill ribbons are wound onto 1.5" diameter cores and are available in a range of NexGen and Legacy colors. FX refill kits are direct replacements from the OEM ribbons and are intentionally designed to work in the EDGE® FX Caddy supplied by the OEM. Part numbers that begin with a G use ZeroNine NexGen Ribbon Chemistry. Part numbers that begin with an F use ZeroNine original Legacy formulation.
